File:ED Section 6, equation 2 6.2.1.png

IFs can make two adjustments to the coefficients produced by the cross-sectionally estimated functions (shown here as LABCOEFFSFromFunction – in the code the variable name above and below on both sides of the equation is simply LABCOEFFS). Most simply, model users can use a global parameter (labcoeffsm) to change the labor coefficients by skill level for any or all of the six sectors.
