File:Section 5 Equation 1 in 5.4.2.3.png

At this point the sums for each country of sectoral exports across all targets and of sectoral imports from all sources will not equal the monadic calculation of those values in variables XS and MS, respectively. Because by far the most common use of the model imposes monadic totals on dyadic patterns, a constraining process does that. The first step is computing the sums of exports and imports from the dyadic calculations (XSDyadCalc and MSDyadCalc).
